

Cyber attack in Company

Saketh Sripada

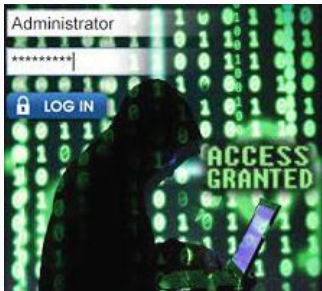

Incident Description

Earlier today around 9 am, there was a report of unauthorized access to our database containing some user records. Later, a suspected data breach was confirmed with the hackers gaining unauthorized access to the records. This was verified by the cybersecurity team with user account information for logging in being compromised. Luckily, not much sensitive data such as SSN were leaked.

Impact

The hacker may use the compromised accounts in order to perform other attacks on the service and or engage in illicit transactions on our platform. This could result in downtime that could cause a million dollars in losses, and also could result in potential illegal activities and trades made on our platform.

Recovery

In order to recover from this attack we will block all future log in attempts for every single user until they change their login information, and enforce strict anti virus softwares on all employee computers to prevent unauthorized access to system data, as well as have the IT team manually update and check all systems for backdoors and other potential vulnerabilities.
