

1. One aspect that I may intellectually copyright could be the specific logic that is used to create the functionality, or the exact design of the layout, with four boxes and a progress bar, USED for the purpose of a PC system monitor. However, this may be too broad to be considered copyrightable.
2. The app collects data related to the user's computer's hardware, such as temperatures and usage percentages. To be used ethically, it must be ensured that this data is being collected solely for the purpose of showing it to the user, and not using it for any other purposes. For example, if a user has very high temperatures for low usages, it should not attempt to advertise CPU or GPU cooling solutions, as this would be unethical.
3. Acceptable Uses:
 - Using the app for monitoring system health of computers
 - Using data collected by the app for research or educational purposesUnacceptable Uses:
 - Using data collected by the app for targeted advertising or commercial activity
 - Distributing the app commercially without consent
 - Modifying the app in any way to gain unauthorized access to anythingConsequences:
 - Suspension or ban from using the app
 - Legal action in cases of unauthorized accessResponsible Use:
 - Users must ensure that their usage of the app does not negatively impact the privacy or security of other users, and does illegally access any material.
4. DRM is the technologies and steps that are taken to monitor and regulate the uses of copyrighted content. In my app, there is no content that needs a lot of monitoring, so simple measures such as making sure the app's code cannot be tampered with for malicious activity and adding a license upon release should be sufficient.
